

CompTIA Network +

# Chapter 2

## Dissecting the OSI Model

Updated 8-20-16

# Objectives

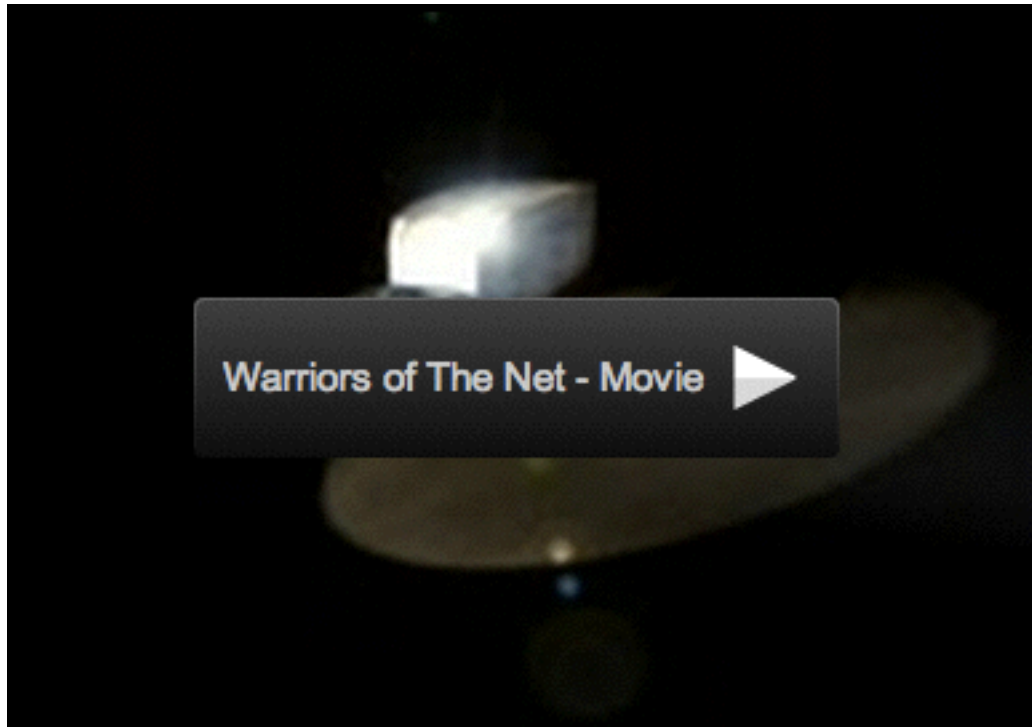

- What is the purpose of a Network model?
- What are the layers of the OSI model?
- What are the characteristics of each layer of the OSI model?
- How does the TCP/IP stack compare to the OSI model?
- What are the well-known TCP and/or UDP port numbers for a given collection of common applications

# The Purpose of Reference Models

- It breaks network communication into smaller, simpler parts that are easier to develop.
- It facilitates standardization of network components to allow multiple-vendor development and support.
- It allows different types of network hardware and software to communicate with each other.
- It prevents changes in one layer from affecting the other layers so that they can develop more quickly.
- It breaks network communication into smaller parts to make learning it easier to understand.

# Protocol Data Unit (PDU)

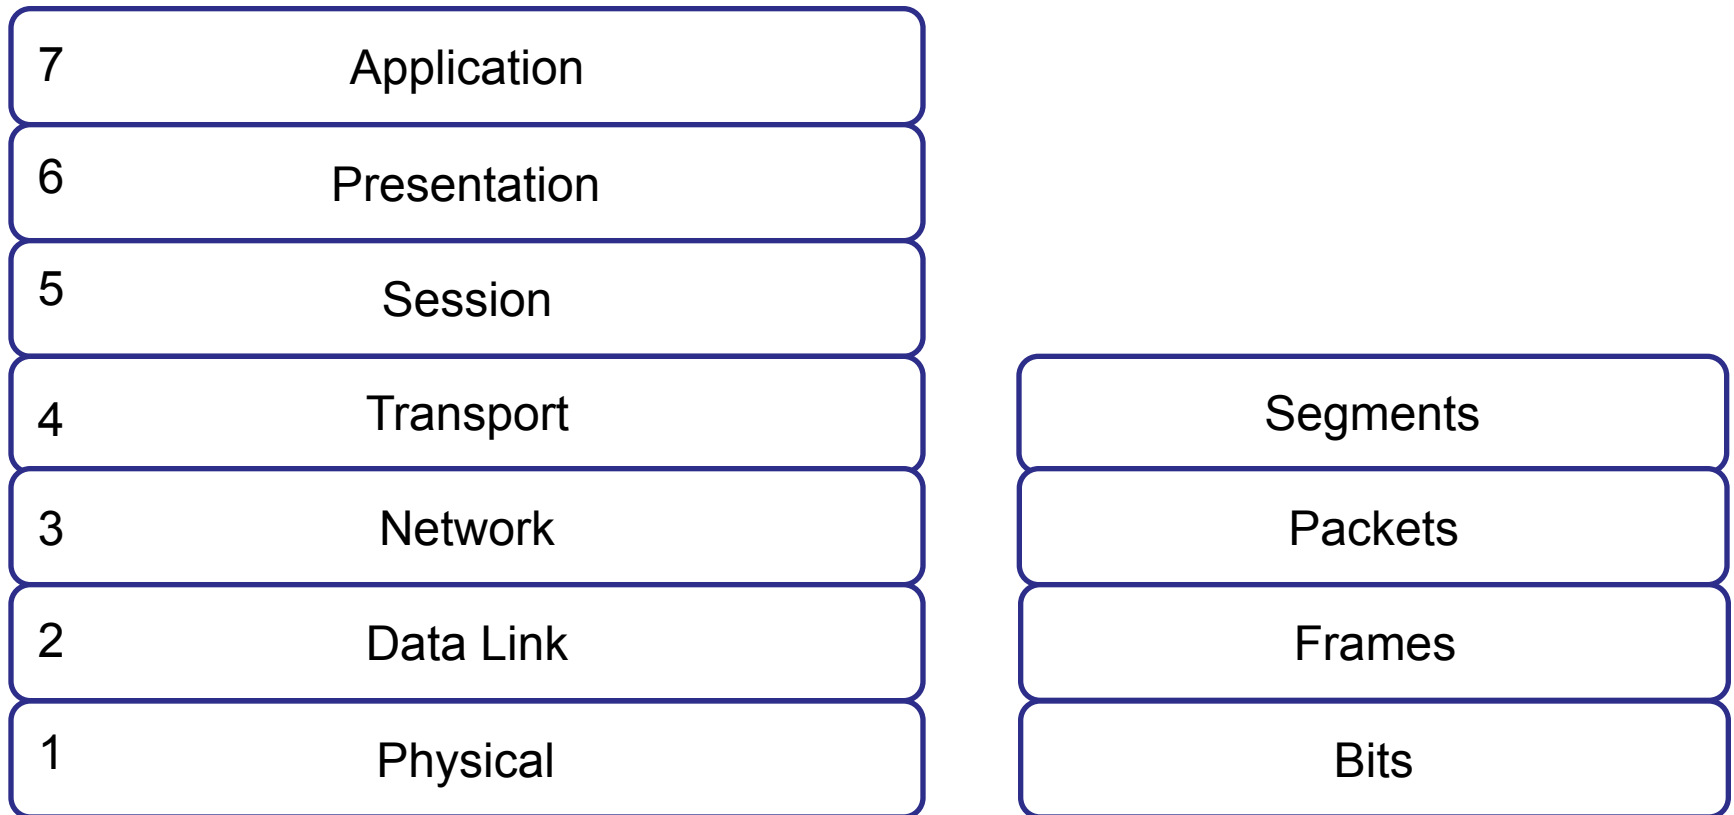

Figure 2-3 PDU Names

# Quick Summary of Layers 1-4

4	Transport	TCP & UDP Ports	Service
3	Network	Routers, IP Address	WAN
2	Data Link	Switches, MAC Address	LAN
1	Physical	Cables	

# OSI Layers in Wireshark

- 1 ▶ Frame 1216: 467 bytes on wire (3736 bits)
- 2 ▶ Ethernet II, Src: Apple\_4f:2b:55 (28:cf:e9:4f:2b:55)
- 3 ▶ Internet Protocol Version 4, Src: 192.168.1.141
- 4 ▶ Transmission Control Protocol, Src Port: 58163
- 7 ▶ Hypertext Transfer Protocol

# Physical Layer

- How Bits are represented on the medium
- Writing standards for connectors and jacks
- Physical topology
- Synchronizing bits
- Bandwidth usage
- Multiplexing strategy

Figure 2-4 Layer 1: Physical Layer

# Wiring Standards

**Figure 2-7** TIA/EIA-568-B Wiring Standard for an RJ-45 Connector

# Asynchronous and Synchronous Communications

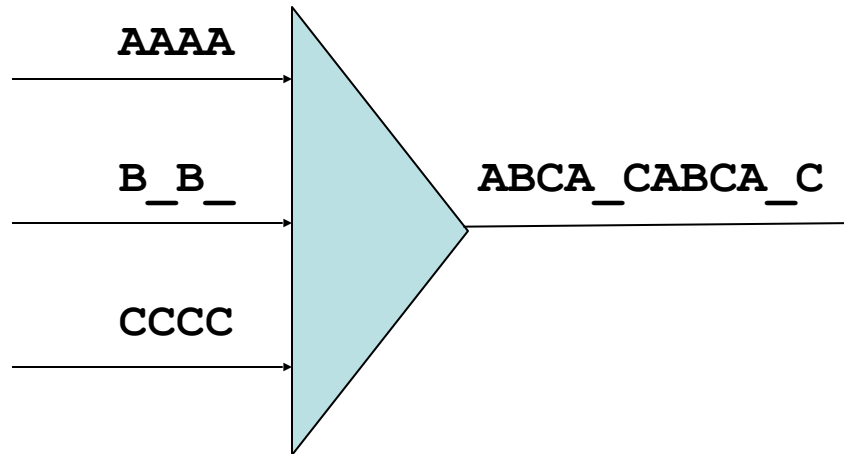

- Synchronizing Bits
  - Two devices must agree on when one bit stops and another bit starts
- **Asynchronous**
  - Uses start and stop bits
- **Synchronous**
  - Internal clocks are synchronized at each end of the cable

# Bandwidth Usage

- **Broadband**
  - Multiple channels share the same medium
  - Ex: cable TV uses **frequency division multiplexing** (each channel uses a different frequency range)
- **Baseband**
  - The whole medium is used for one transmission
  - Example: Ethernet

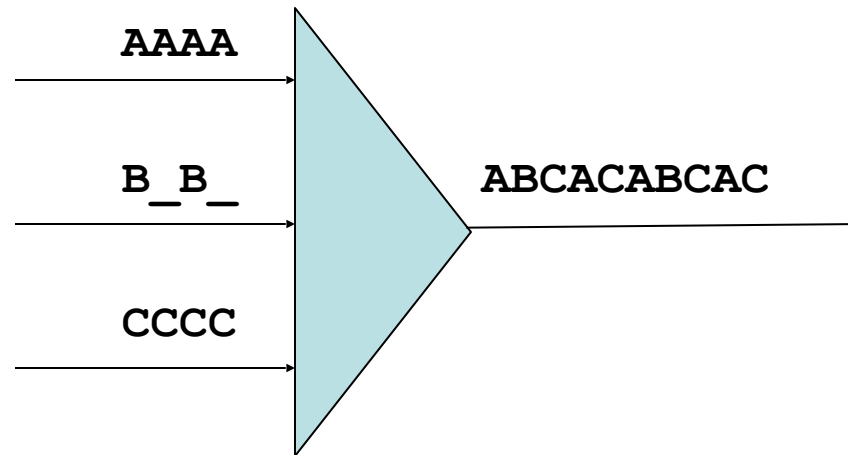

# Time-Division Multiplexing (TDM)

- Each channel gets the same amount of time on the wire

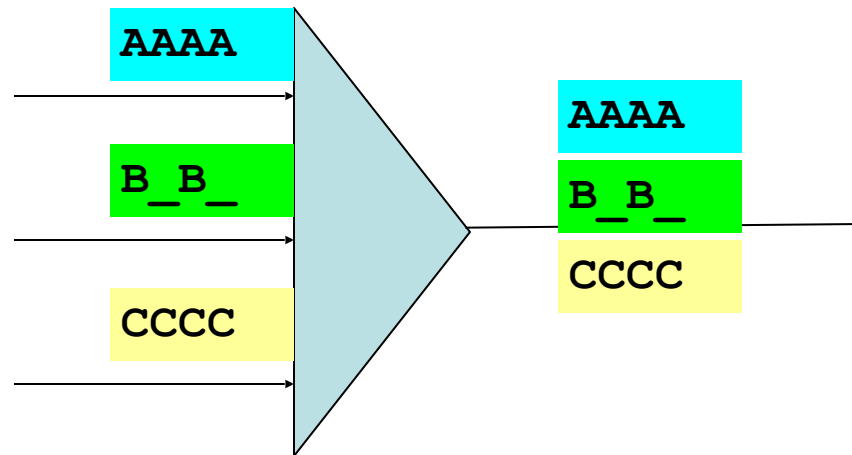

# Statistical Time-Division Multiplexing (StatTDM)

- Busy channels get more time on the wire

# Frequency Division Multiplexing (FDM)

- Example: signals sent with different colors through the same fiber optic cable

# Layer 1 Devices

- Cables
- Wireless access points
- Hubs
  - Because they don't pay any attention to addresses, they just deliver signals to every connected device like a crossover cable

# Data Link Layer

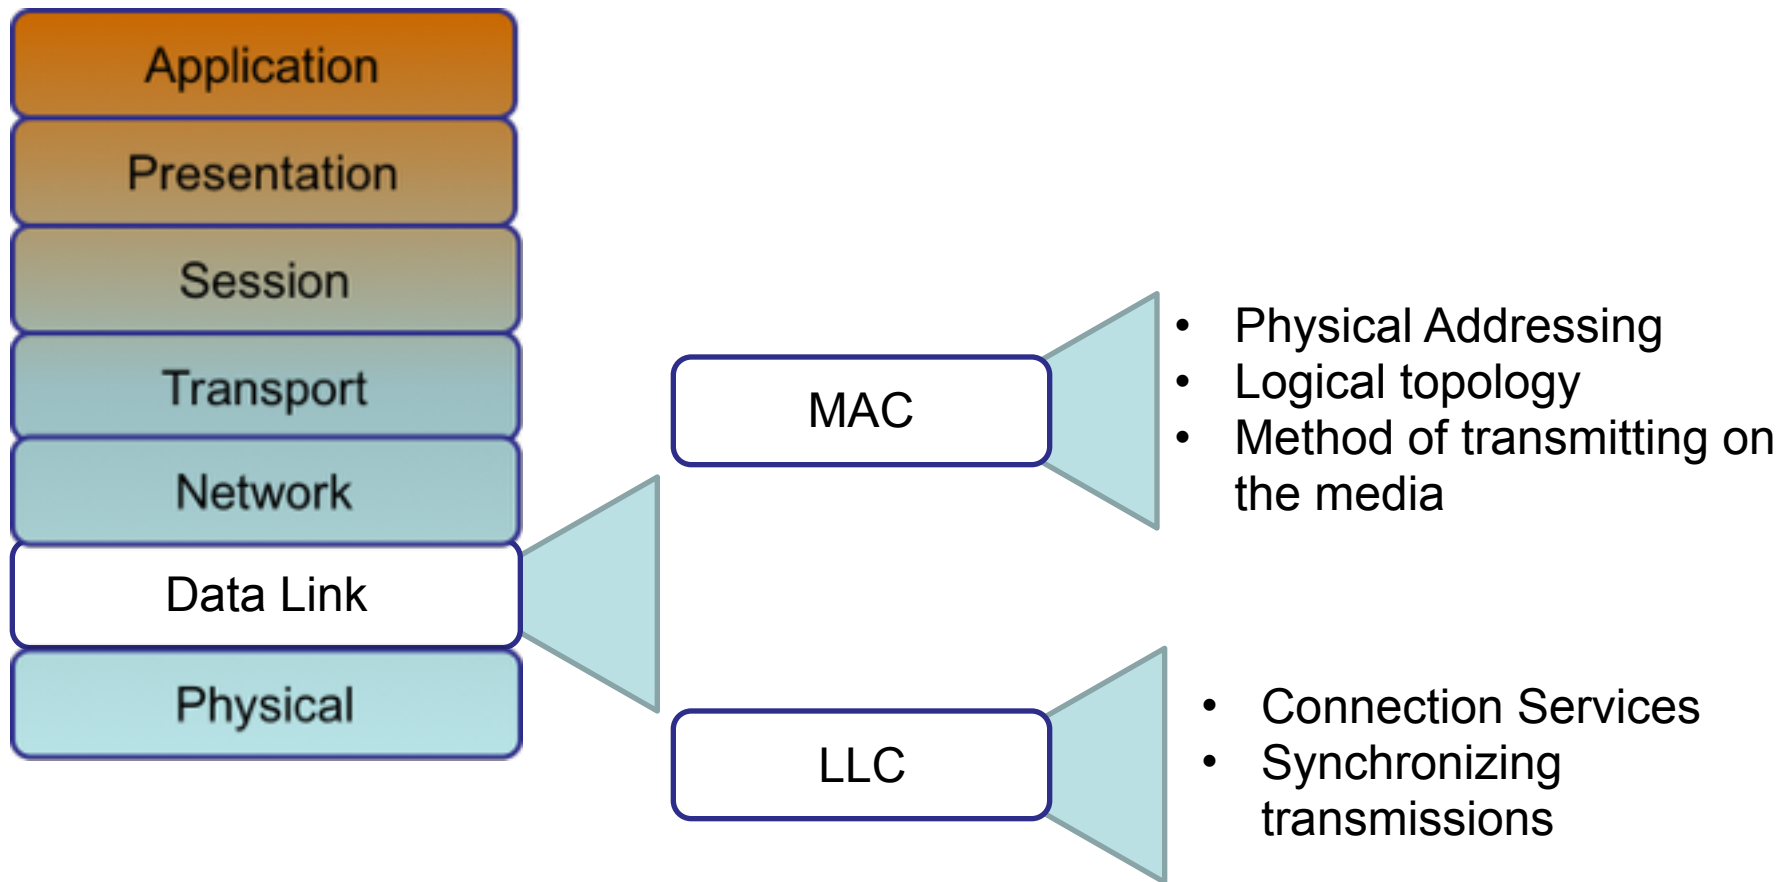

Figure 2-8 Layer 2: The Data Link Layer

# MAC Addresses

- IPCONFIG /ALL
- Physical Address
- Built into the network interface

```
Ethernet adapter Local Area Connection:

Connection-specific DNS Suffix . : localdomain
Description . . . . . : Intel(R) PRO/1000 MT Network Connection
Physical Address. . . . . : 00-0C-29-52-34-92
DHCP Enabled. . . . . : Yes
Autoconfiguration Enabled . . . . : Yes
IPv6 Address. . . . . : 2::4(Preferred)
Link-local IPv6 Address . . . . . : fe80::5a7:33af:ed86:b39f%11(Preferred)
IPv4 Address. . . . . : 192.168.119.154(Preferred)
Subnet Mask . . . . . : 255.255.255.0
Lease Obtained. . . . . : Tuesday, August 20, 2013 12:37:23 PM
Lease Expires . . . . . : Tuesday, August 20, 2013 1:07:23 PM
Default Gateway . . . . . : 192.168.119.2
DHCP Server . . . . . : 192.168.119.254
DHCPv6 IAID . . . . . : 234884137
DHCPv6 Client DUID. . . . . : 00-01-00-01-15-0E-CB-08-00-0C-29-BB-32-CA

DNS Servers . . . . . : 192.168.119.2
Primary WINS Server . . . . . : 192.168.119.2
NetBIOS over Tcpip. . . . . : Enabled
```

# Connection Services

- Flow control
  - Prevents sender from sending data faster than the client can accept it
- Error control
  - When a frame is received, a **checksum** is used to detect errors
    - Usually a **Cyclic Redundancy Check (CRC)**
  - If the receiver's checksum does not match the sender's checksum, the frame is discarded and resent

# Layer 2 Devices

- Switches
- Bridges
- Network Interface Cards (NICs)

# Network Layer

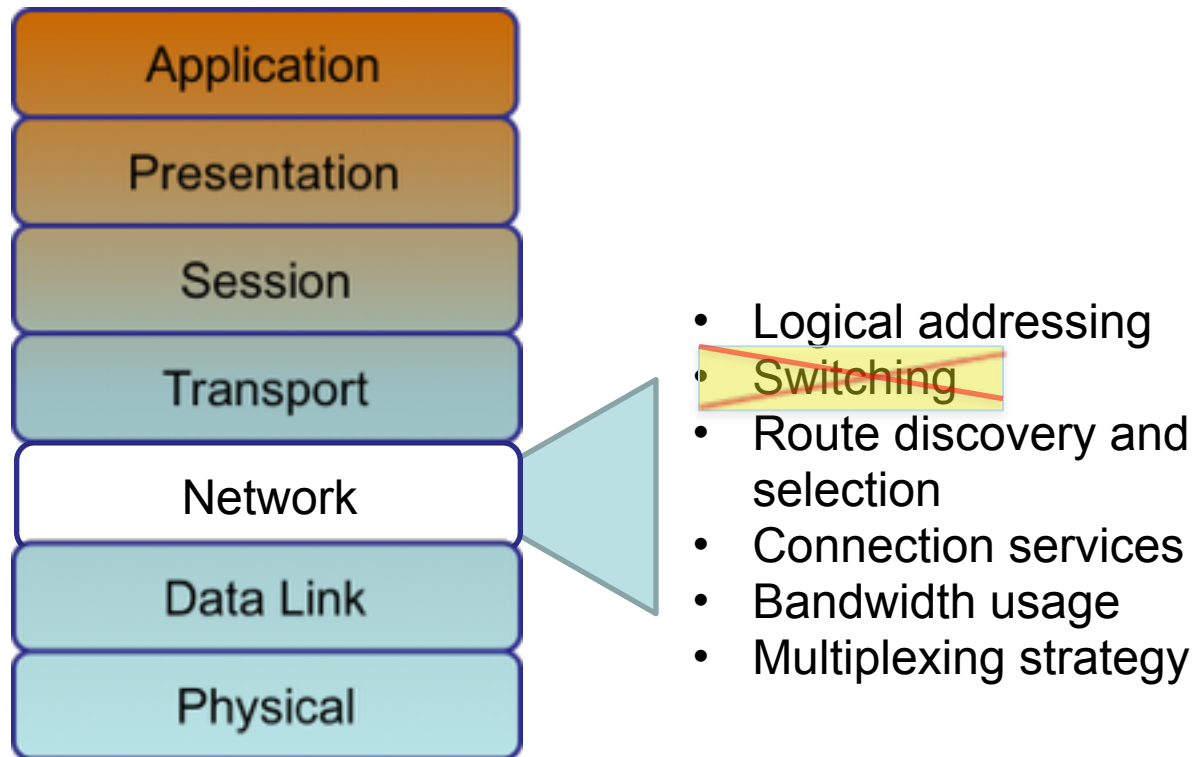

Figure 2-9 Layer 3: The Network Layer

# IP Address

- Logical address
- Changes when the device is moved

```
Ethernet adapter Local Area Connection:

Connection-specific DNS Suffix . : localdomain
Description . . . . . : Intel(R) PRO/1000 MT Network Connection
Physical Address. . . . . : 00-0C-29-52-34-92
DHCP Enabled. . . . . : Yes
Autoconfiguration Enabled . . . . . : Yes
IPv6 Address. . . . . : 2::4(Preferred)
Link-local IPv6 Address . . . . . : fe80::5a7:33af:ed86:b39f%11(Preferred)
IPv4 Address. . . . . : 192.168.119.154(Preferred)
Subnet Mask . . . . . : 255.255.255.0
Lease Obtained. . . . . : Tuesday, August 20, 2013 12:37:23 PM
Lease Expires . . . . . : Tuesday, August 20, 2013 1:07:23 PM
Default Gateway . . . . . : 192.168.119.2
DHCP Server . . . . . : 192.168.119.254
DHCPv6 IAID . . . . . : 234884137
DHCPv6 Client DUID. . . . . : 00-01-00-01-15-0E-CB-08-00-0C-29-BB-32-CA

DNS Servers . . . . . : 192.168.119.2
Primary WINS Server . . . . . : 192.168.119.2
NetBIOS over Tcpip. . . . . : Enabled
```

# Switching

- Packet switching
  - Data is broken into packets
  - Many packets travel along network connections like cars on a freeway
- Circuit switching
  - A physical line is dedicated to each connection
  - Ex: old copper landline phone systems
- Message switching
  - Store-and-forward, like email

# Layer 3 Devices

- Routers
- Multilayer Switches

# Transport Layer

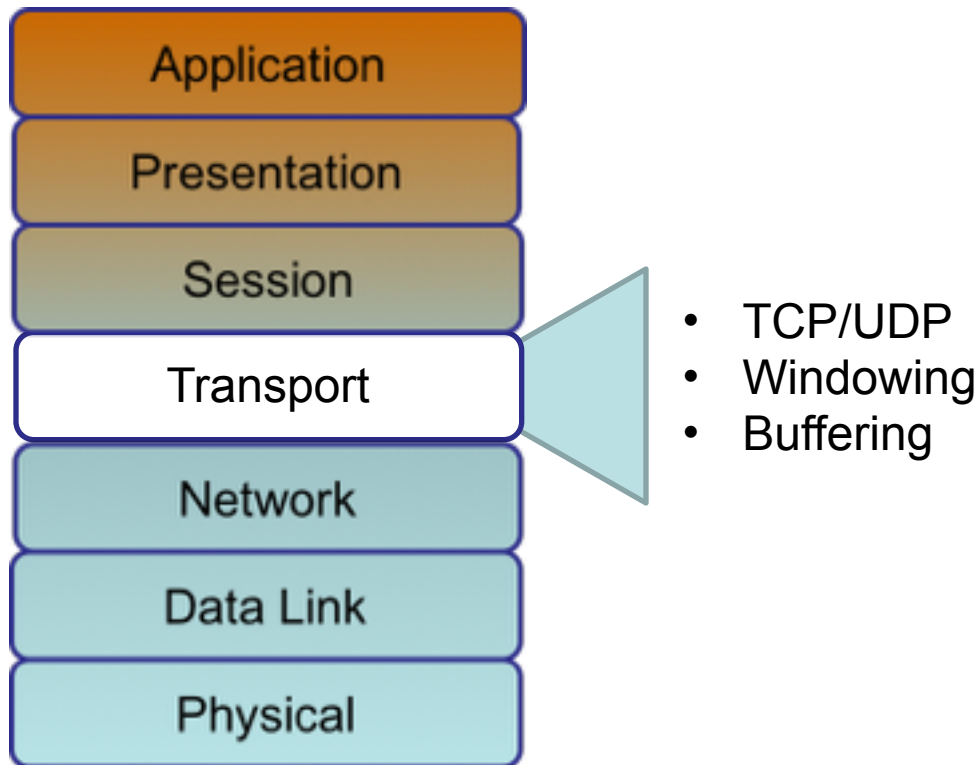

Figure 2-10 Layer 4: The Transport Layer

# TCP and UDP

- Transmission Control Protocol (TCP)
  - Connection-oriented and reliable
  - Handshake makes sure both ends are ready
  - Segments are acknowledged and resent if necessary
- User Datagram Protocol (UDP)
  - Connectionless and unreliable
  - No handshake
  - Best-effort delivery, no acknowledgements

# TCP Sliding Window

# ICMP

(Internet Control Message Protocol)

- At layer 4
- Used by ping and traceroute, and to indicate errors such as dropped packets

# Session Layer

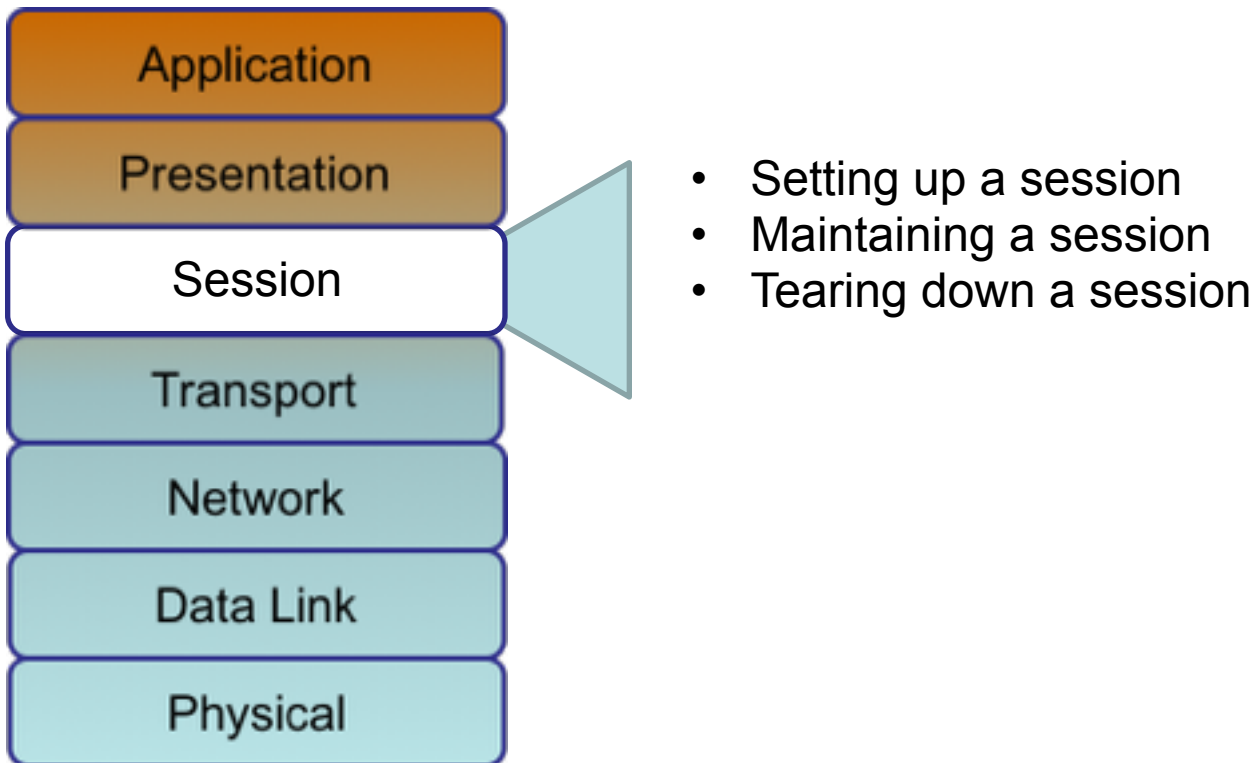

Figure 2-12 Layer 5: The Session Layer

# Example of a Session

- User logs in with a username & password
- All data now has a special significance until that user logs off, or the session times out, or is terminated some other way
- Layer 6 Protocol
  - H.323 (voice or video)
  - NetBIOS (file sharing)

# Presentation Layer

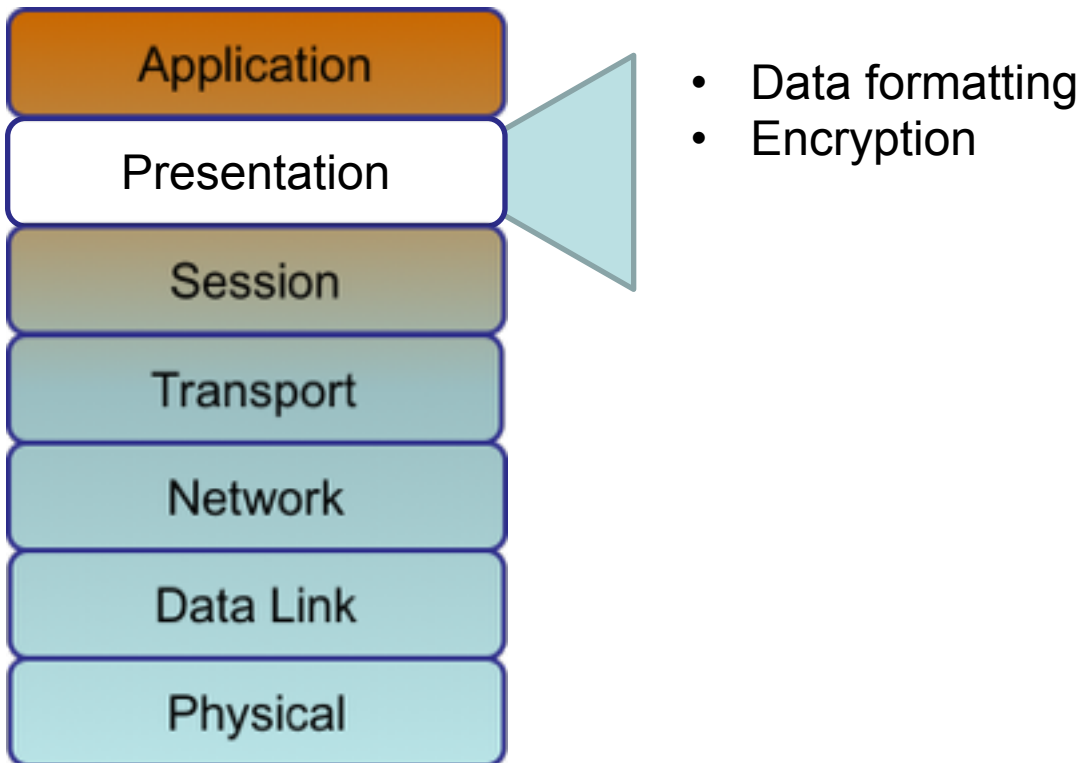

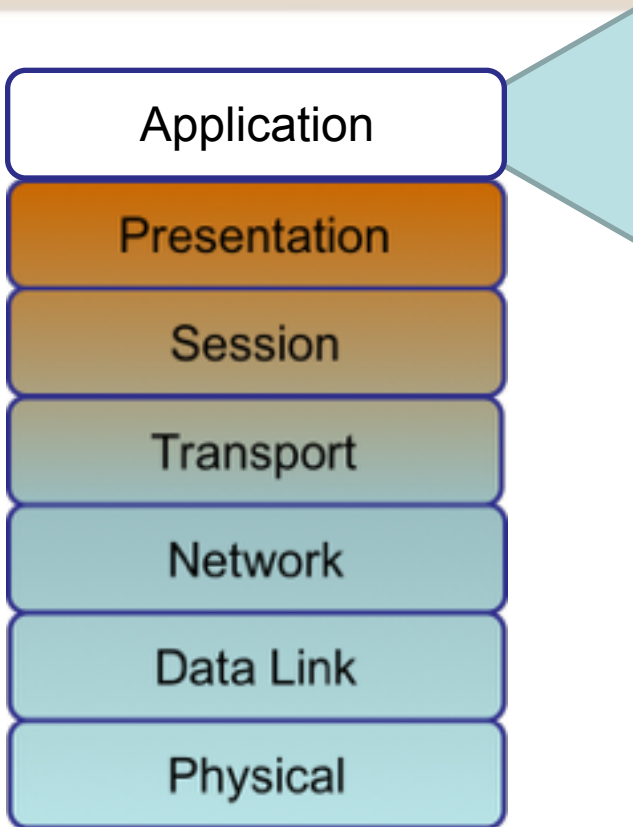

Figure 2-13 Layer 6: The Presentation Layer

# Application Layer

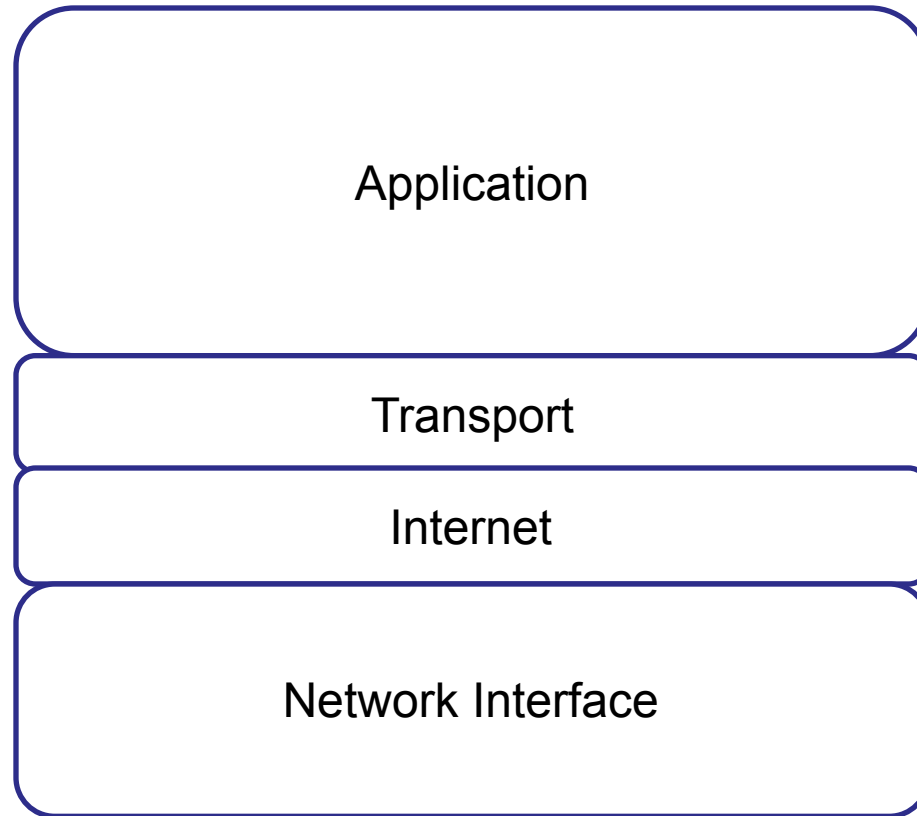

- Application services
- Service advertisement

# Application Layer

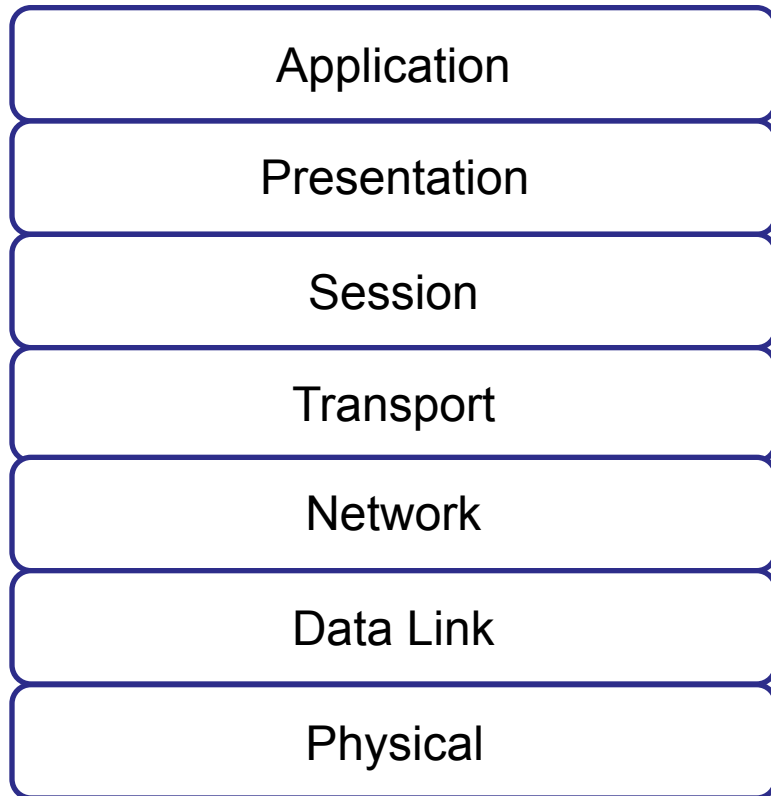

- Closest to the user
- Hands data to an application in the format it expects, with no addresses or other transmission artifacts
- Examples: a downloaded file, an email message

# The TCP/IP Stack

# The TCP/IP and OSI Models Compared

## OSI Stack

## TCP/IP Stack

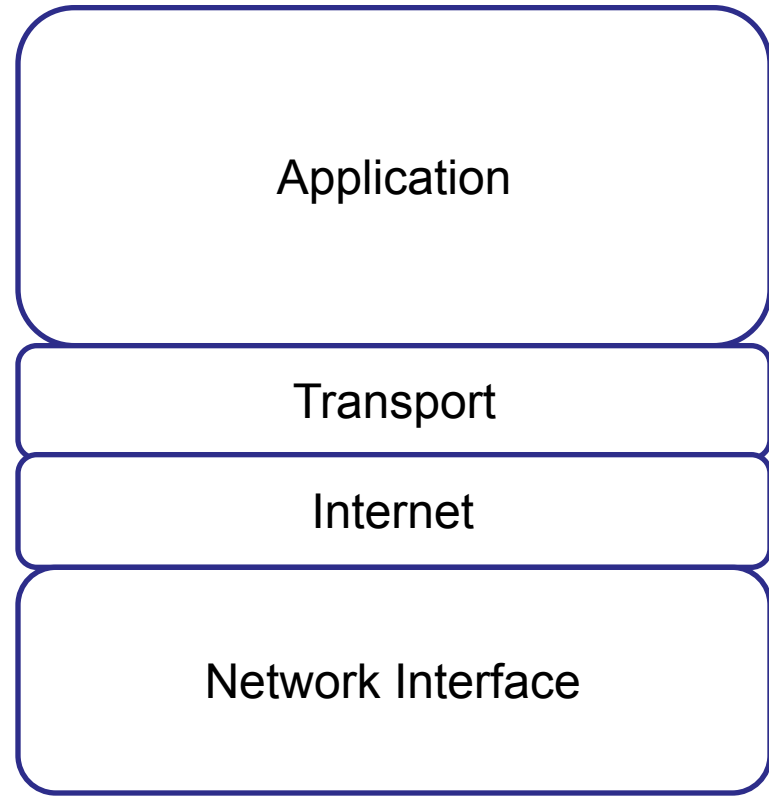

Figure 2-15 TCP/IP Stack

# IP Ver4 Header

Version	Header Length	Type of Service	Total Length	
Identification			IP Flags	Fragment Offset
TTL	Protocol		Header Checksum	
Source Address				
Destination Address				
IP Option (Variable Length)				

# TTL (Time-to-Live)

- TTL decreases by one each time the packet is forwarded by a router
- If TTL reaches zero, the packet is discarded
- This eliminates packets trapped in **routing loops**

# Demo: Routing Loop

```
Administrator: cmd - Shortcut (2)

C:\>ping 2001:05c0:1000:000b:0000:0000:0000:10ef

Pinging 2001:5c0:1000:b::10ef with 32 bytes of data:
Reply from 2001:5c0:1000:b::10ef: TTL expired in transit.
Reply from 2001:5c0:1000:b::10ef: TTL expired in transit.
Reply from 2001:5c0:1000:b::10ef: TTL expired in transit.
Reply from 2001:5c0:1000:b::10ef: TTL expired in transit.

Ping statistics for 2001:5c0:1000:b::10ef:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),

C:\>tracert 2001:05c0:1000:000b:0000:0000:0000:10ef

Tracing route to 2001:5c0:1000:b::10ef over a maximum of 30 hops

  0  99 ms    97 ms    96 ms    2001:5c0:1000:b::10ec
  1  96 ms    98 ms   104 ms   ix-5-0-1.6bb1.MIT-Montreal.ipv6.as6453.net [2001:5a0:300::5]

```

# TCP Header

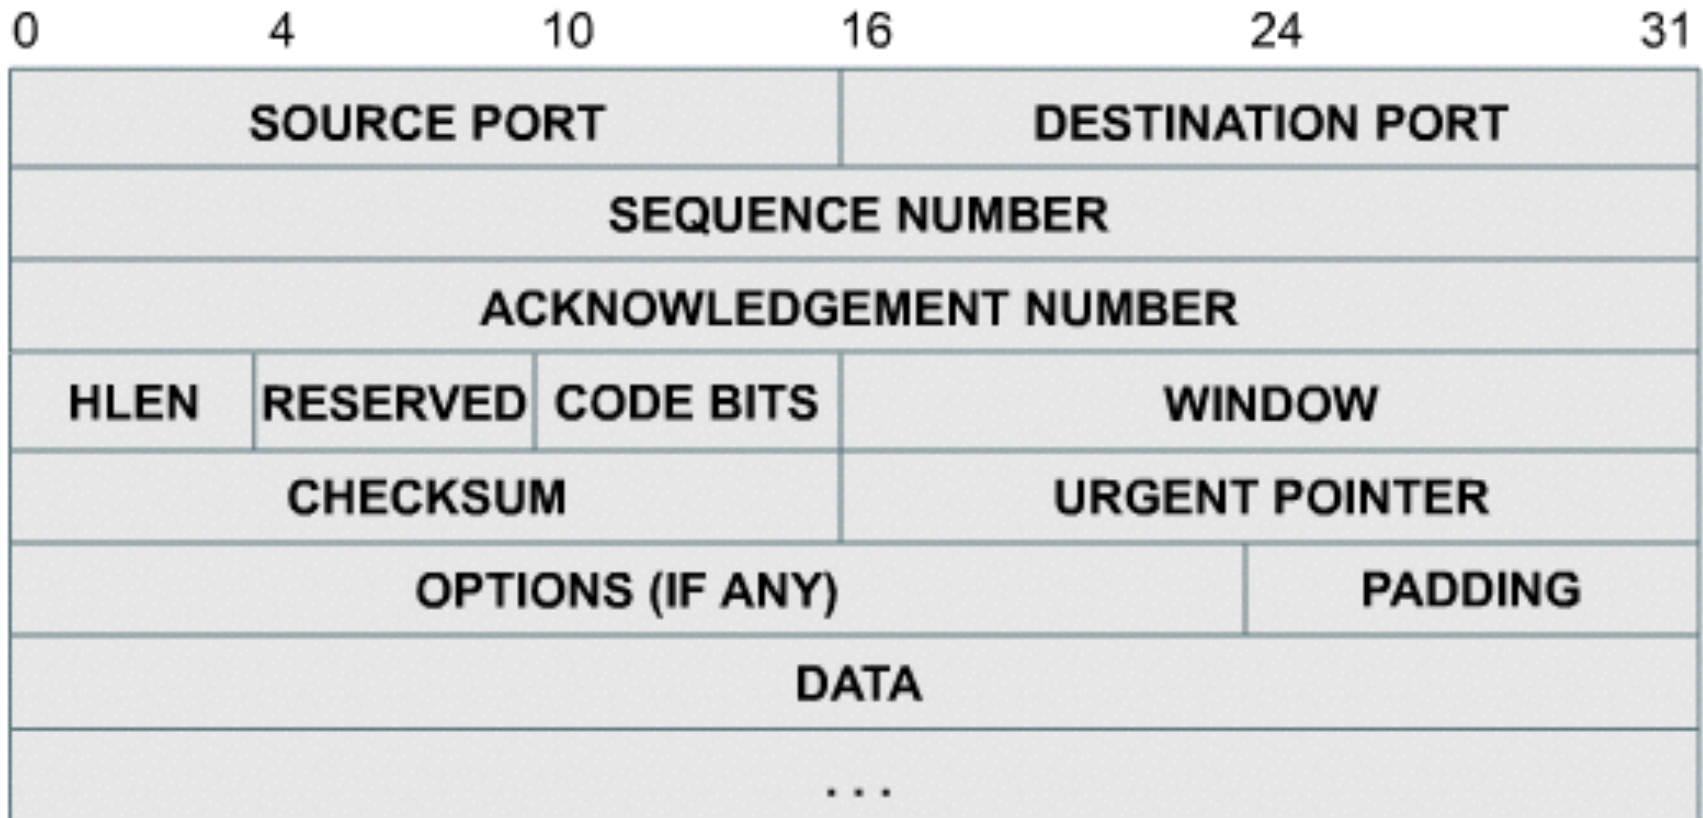

Figure 2-17 TCP Segment Format

# TCP Header Fields

- Port numbers
  - Indicate which program on the end device should receive the data
  - Examples: Port 25 for email, 80 for HTTP
- Window size
  - Number of bytes that can be sent before waiting for an ACK

# TCP Header Fields

- Sequence and Acknowledgement numbers
  - Used to put packets in order to reassemble files and other large messages
- Flags like SYN and ACK are used for the TCP handshake and to acknowledge data received

# UDP Header

- No handshake, acknowledgements, sequencing, or flow control

# Common Ports

Link "Net 5" for flash cards

DNS (Domain Name System)	TCP/UDP 53
HTTP (Hypertext Transfer Protocol)	TCP 80
SMTP (Simple Mail Transfer Protocol)	TCP 25
POP (Post Office Protocol)	TCP 110
Telnet	TCP 23
DHCP (Dynamic Host Configuration Protocol)	UDP 67 (IPv4 client) and 68 (IPv4 server);
FTP (File Transfer Protocol)	TCP 20 (data) and 21 (control)
TFTP (Trivial File Transfer Protocol)	UDP 69
NBNS (NetBIOS Name Service)	UDP/TCP 137
IMAP4 (Internet Message Access Protocol)	TCP 143
SNMP (Simple Network Management Protocol)	TCP/UDP 161
HTTPS (Hypertext Transfer Protocol Secure)	TCP 443
NTP (Network Time Protocol)	UDP 123
SSL (Secure Sockets Layer)	TCP 443
SSH (Secure Shell)	TCP 22

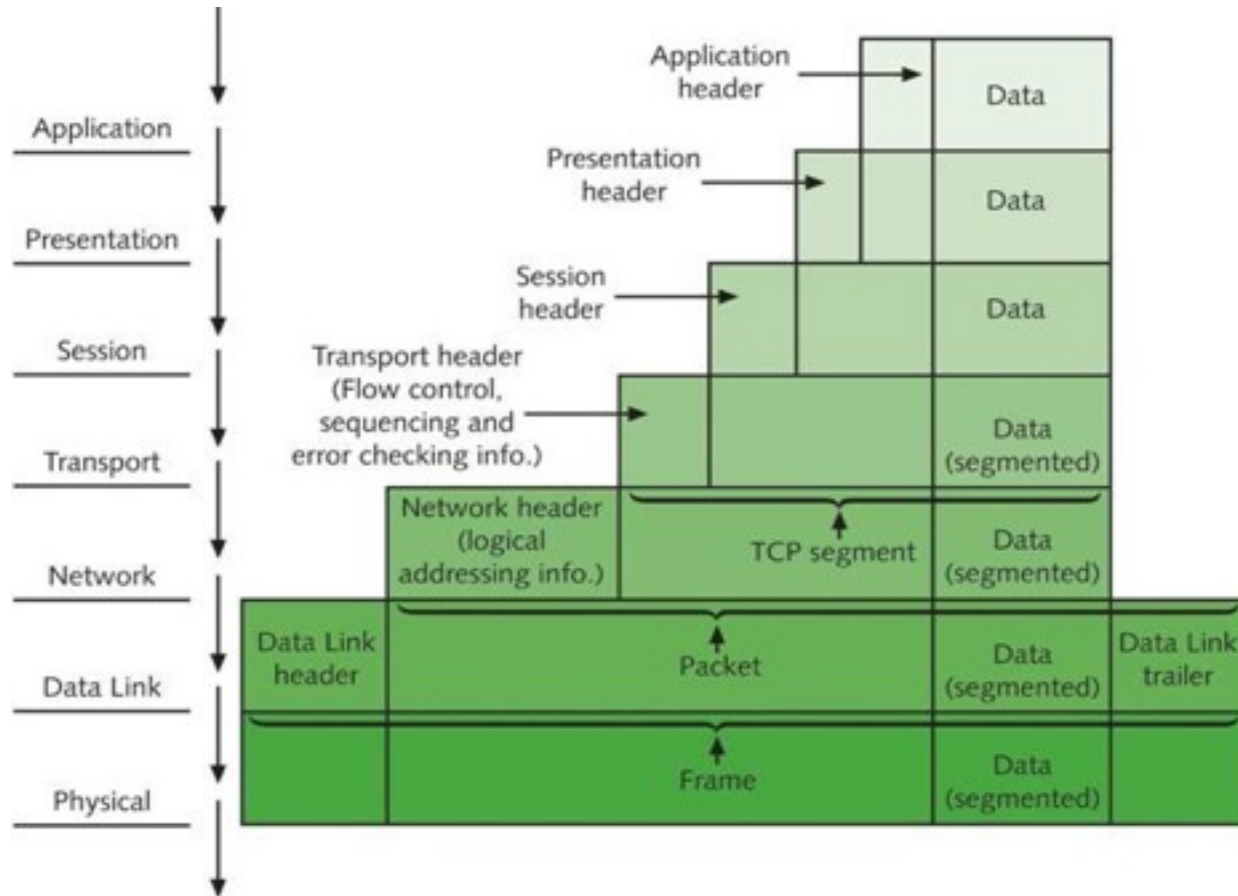

# Port Types

**Port numbers are assigned in various ways, based on three ranges:**

- System Ports (0-1023), System Ports are assigned by IETF process for standards-track protocols, as per RFC6335. **Also known as well-known-ports**
- User Ports (1024-49151) ,User Ports are assigned by IANA using the "Expert Review" process, as per RFC6335
- Dynamic and/or Private Ports (49152-65535), Dynamic Ports are not assigned, they are dynamically created as your computer need them. **Also known as ephemeral ports.**
